How to Read Harmonic Notation

By Douglas Niedt

You are on DouglasNiedt.com

Welcome to the wacky world of harmonic notation. Harmonic notation for the guitar is a mishmash of contradictions and inconsistencies. Some passages of harmonics in the repertoire are unfathomable as to how they are to be played. But then, you knew that. Since beginning this series of classical guitar technique tips on harmonics, I have received many pleas for help for an explanation of harmonic notation.

First, I will describe the three systems of notation for natural harmonics. Then, I will give details on the many flavors of notation for artificial harmonics.

Natural Harmonic Notation

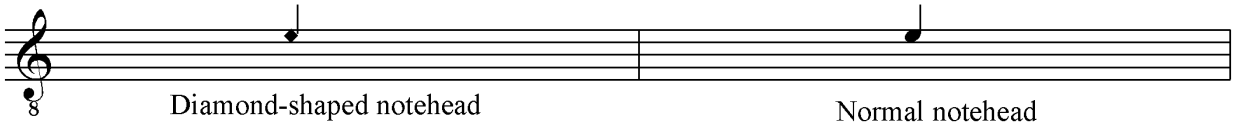
System #1 for notating natural harmonics

The first system notates the open string on which the harmonic will be played with a number indicating which fret to touch. Take note that in this system, the notation does not tell you what pitch is coming out of the guitar. Simple enough, huh?

No. Variations abound:

1. The notehead may or may not be notated as a diamond shape (Ex. #1):

Ex. #1



2. If a diamond shape is used, it may or may not indicate the real note duration (Ex. #2):

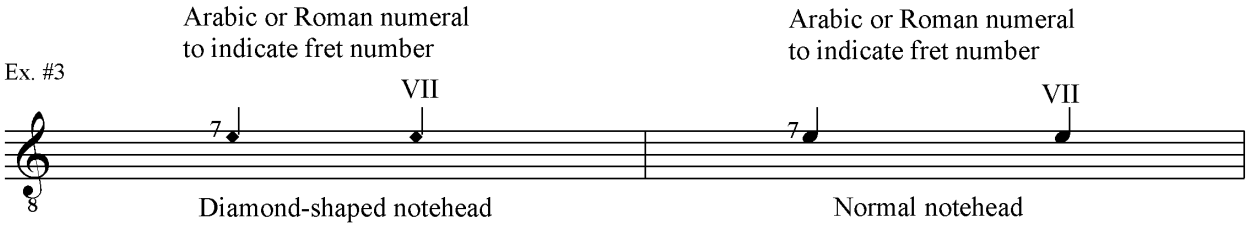
Ex. #2

In context, in this example the diamond notehead indicates the real note value, a quarter note.

In this example the diamond notehead is hollow. But that doesn't mean it's a half note! The composer/arranger assumes you can figure out it is a quarter note.

3. The number indicating the fret at which the left hand touches the string may be Arabic or Roman: (Ex. #3):

Ex. #3



Diamond-shaped notehead

Normal notehead

You are on DouglasNiedt.com

4. The composer/arranger may add one of these terms above the measure:

- Harmonic (Harm., Har.)
- Natural Harmonic (Nat. Harm, Nat. Har, N.H.)

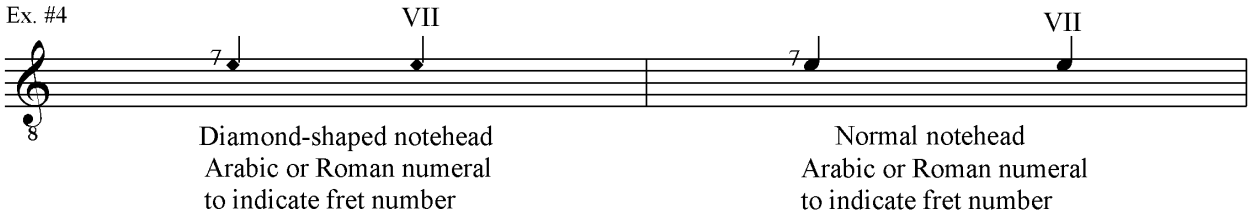
- Armonico or Armonic, (Arm, Ar.)
- Or, it may say nothing!

See Ex. #4 for all these variations.

One of these terms may be placed above the measure:

Harmonic or Harm. or Har.
Natural Harmonic or Nat. Harm., Nat. Har., N.H.
Armonico or Armonica, Arm. or Ar.
H7 or HVII

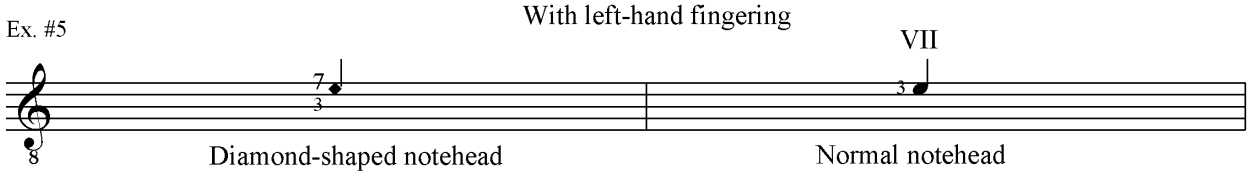
Or nothing may be placed above measure!



Diamond-shaped notehead
Arabic or Roman numeral
to indicate fret number

Normal notehead
Arabic or Roman numeral
to indicate fret number

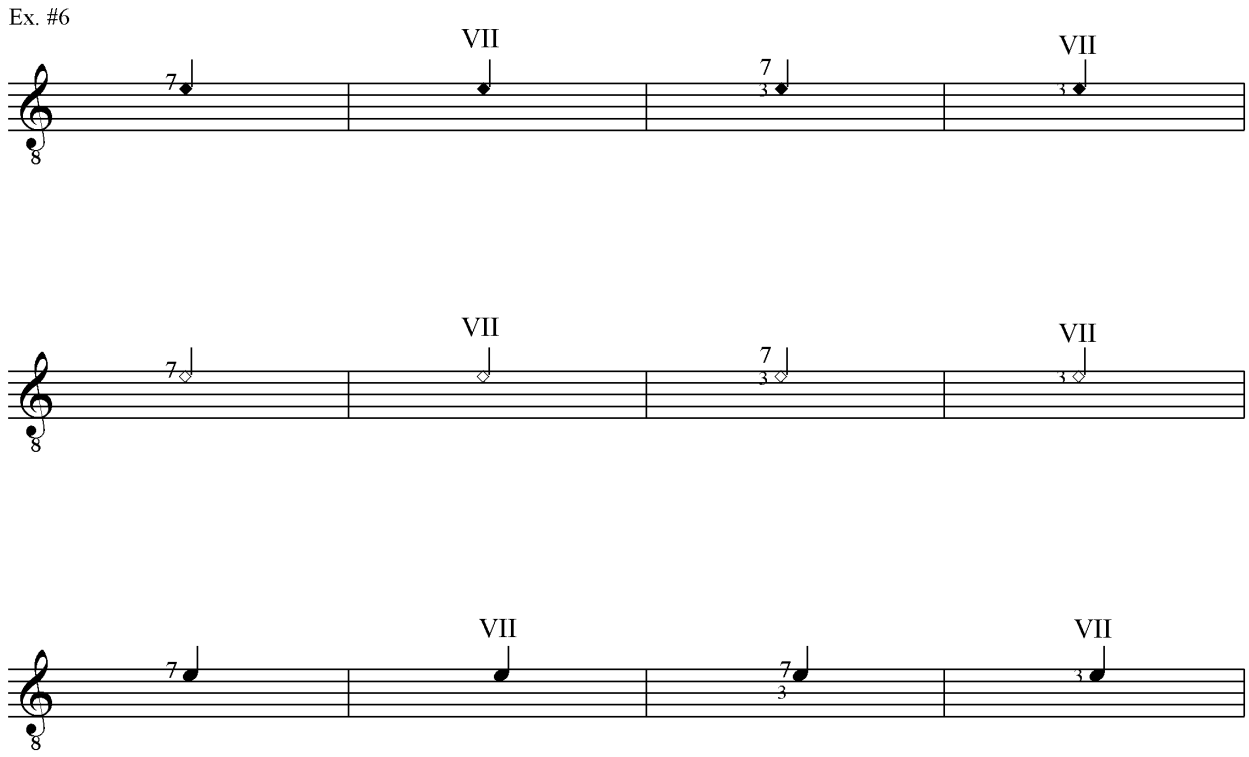
5. Left-hand fingering may or may not be present (Ex. #5):



Diamond-shaped notehead
Arabic numeral for fret
Arabic numeral for left-hand fingering

Normal notehead
Roman numeral for fret
Arabic numeral for left-hand fingering

Therefore, THE SAME HARMONIC may be indicated in any of the following twelve ways (Ex. #6):

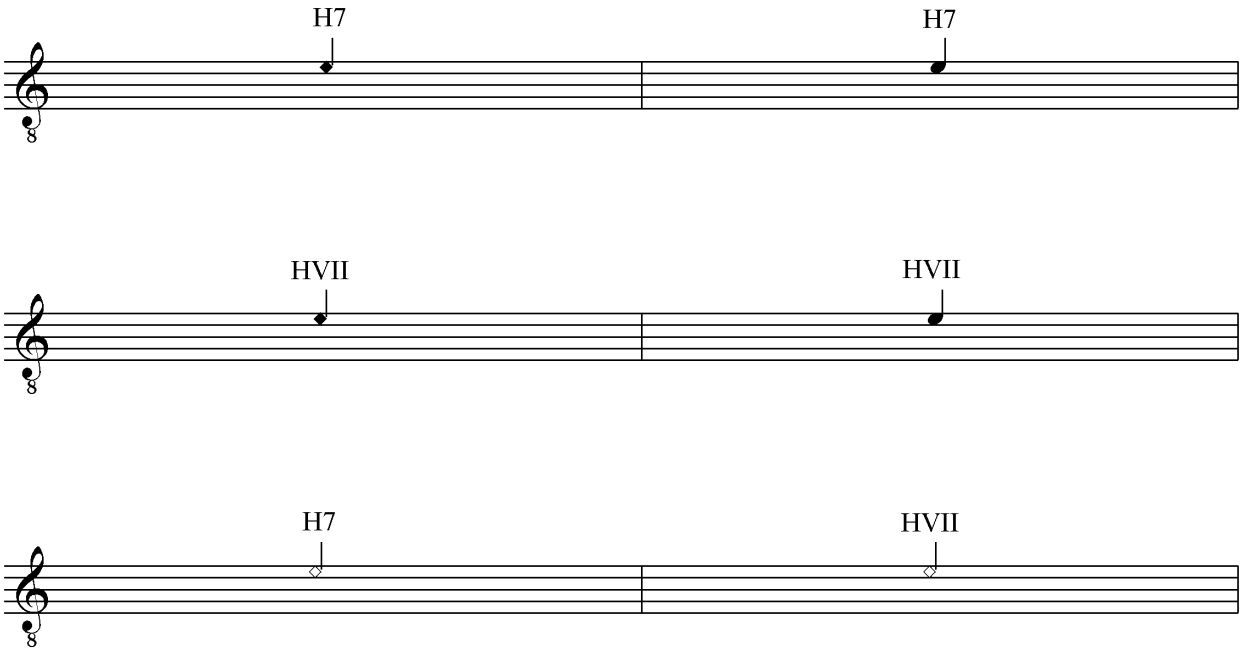


You are on DouglasNiedt.com

Any of those twelve can take on one of the twelve added descriptive terms mentioned above (harmonic, harm., har., etc.). By my count, so far, that makes 144 possible ways of notating the exact same harmonic.

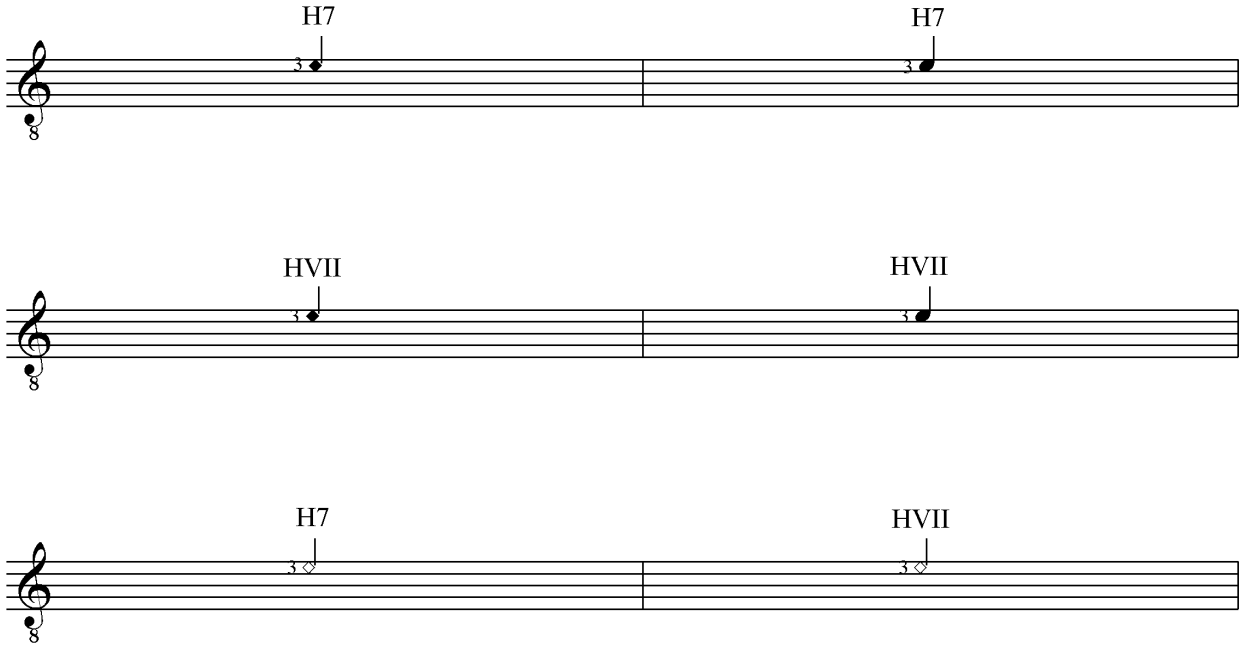
Another way of notating harmonics in this first system is to use the letter H with an Arabic or Roman numeral to denote the fret. That adds these possible versions (Ex. #7):

Ex. #7



Each of the preceding can have left-hand fingering added (Ex. #8):

Ex. #8

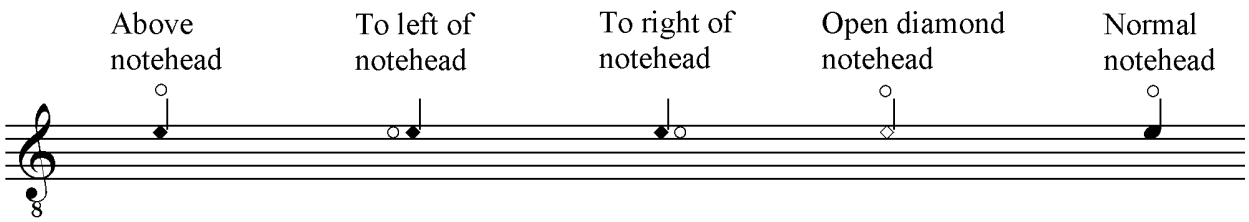


You are on DouglasNiedt.com

That adds twelve more ways to notate our harmonic. According to my math, we are up to 156.

Plus, a small circle may be added above or beside the notehead in all of the preceding examples (Ex. #9):

Ex. #9



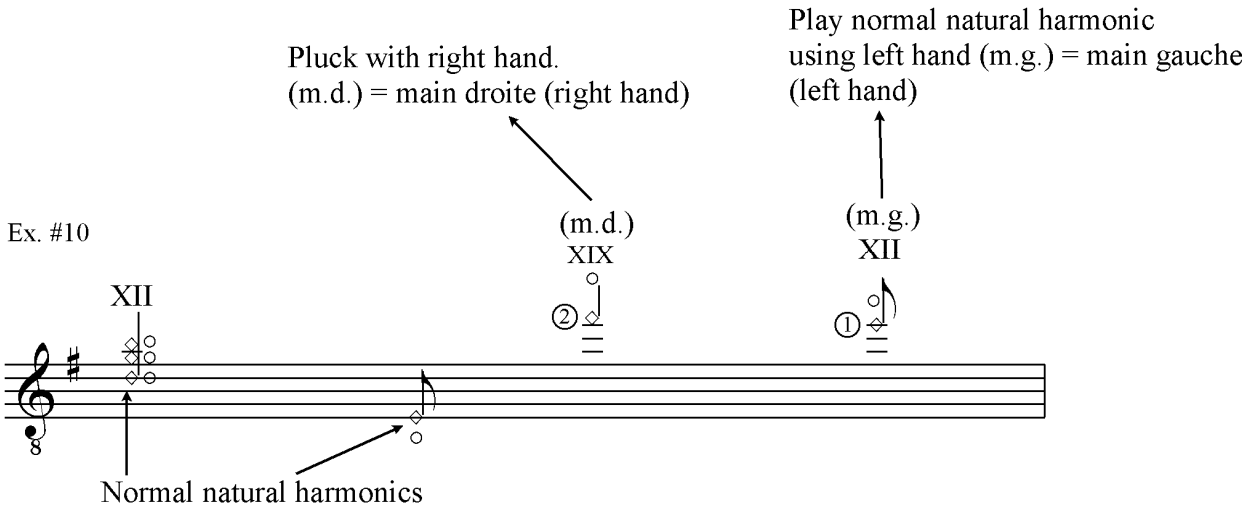
That makes a grand total of 312 ways to notate the same harmonic. And again, that's just with the first of three systems we will look at!

6. As you know, a natural harmonic is normally played with both hands. But it may also be played with the right-hand alone (like an artificial harmonic). Sometimes that will be indicated, sometimes not. When specified, you may see the following notations above the staff or close to the harmonic note:

- Right-hand harmonic (R.H. Harm., R.H. Har.)
- mano derecha ("right hand" in Spanish), (m.d., M.D.)
- main droite ("right hand" in French) (m.d., M.D.)

After playing natural harmonics with right-hand harmonic technique, an indication to return to normal natural harmonic technique may be made by referring to the left hand: mano izquierda in Spanish (m.i. or M.I.) or main gauche in French (m.g. or M.G.).

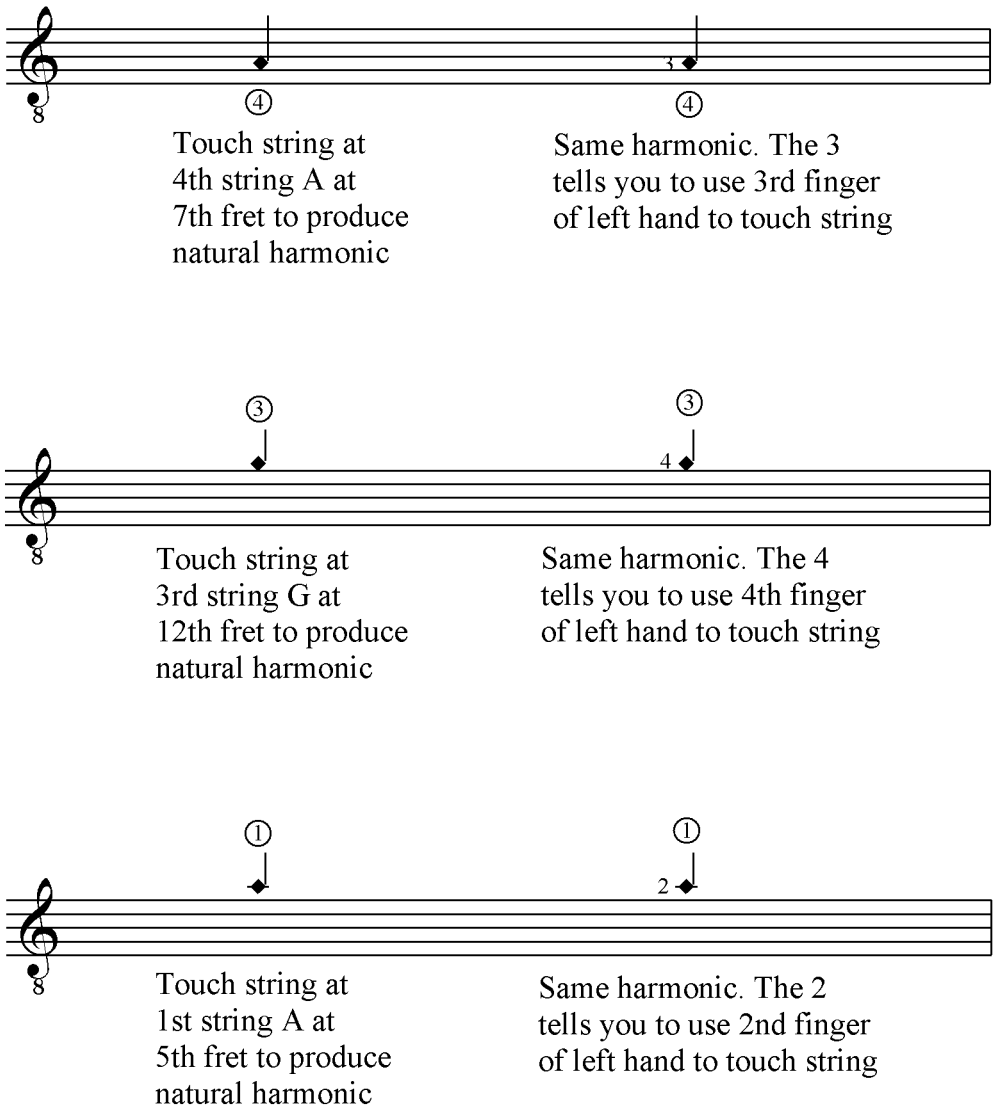
In his arrangement of *Nuages* by Django Reinhardt, Roland Dyens uses both types of natural harmonic technique in the same measure. Notice that the system Dyens uses to notate his harmonics is not the one we are discussing. It is system #3 which we will get to soon. But, this is a very good example of how the normal technique and right-hand technique of producing natural harmonics may be mixed together (Ex. #10):



System #2 for notating natural harmonics

The second system for notating natural harmonics indicates the note where the left-hand finger touches the string to produce the harmonic. Additional numeric information is given to indicate which string the note is on and which left-hand finger to use. Here are three examples (Ex. #11):

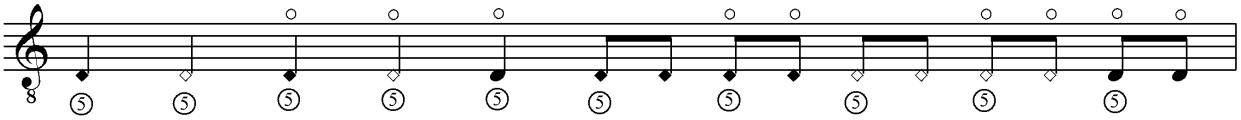
Ex. #11



As with the first system of notation, the notehead may be a diamond or not, solid or hollow, and a circle may or may not be placed somewhere by the notehead. Likewise, one of the terms Harmonic (Harm. or Har.), Natural Harmonic (Nat. Harm., Nat. Har., or N.H.), Armonico or Armonica (Arm. or Ar.) may or may not be used (Ex. #12):

These are all the **exact same harmonic**:
The left-hand finger touches the string at
the 5th string D at the 5th fret

Ex. #12



As before in notational system #1, one of these terms may be placed above the measure:

Harmonic or Harm. or Har.
Natural Harmonic or Nat. Harm., Nat. Har., N.H.
Armonico or Armonica, Arm. or Ar.

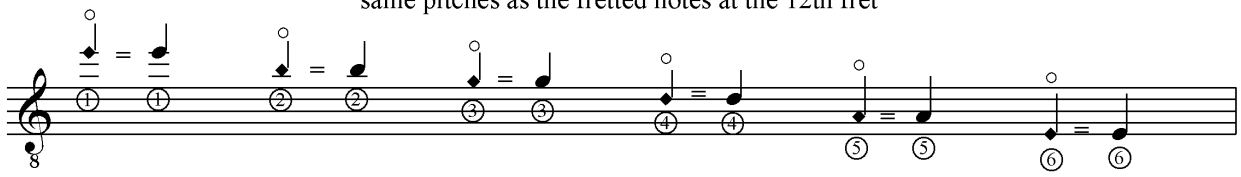
Or nothing may be placed above measure!

The main thing to remember about this system of notation is that the written note may or may not coincide with the pitch produced by the guitar.

At the 12th fret, the pitch of the written note and the pitch that comes out of the guitar are the same (Ex. #13):

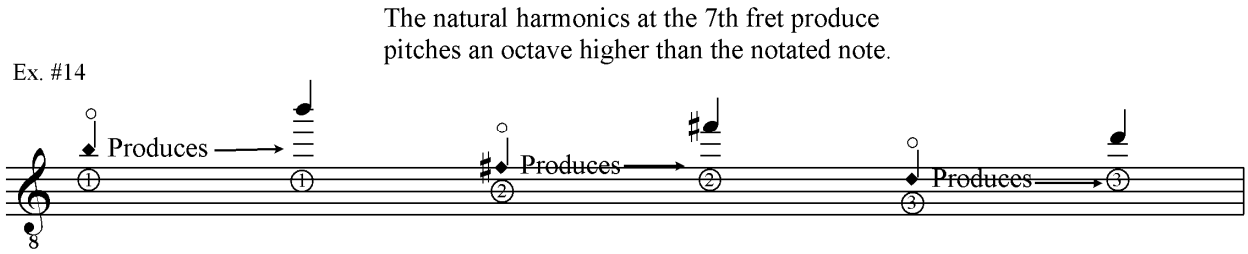
The natural harmonics at the 12th fret produce the same pitches as the fretted notes at the 12th fret

Ex. #13



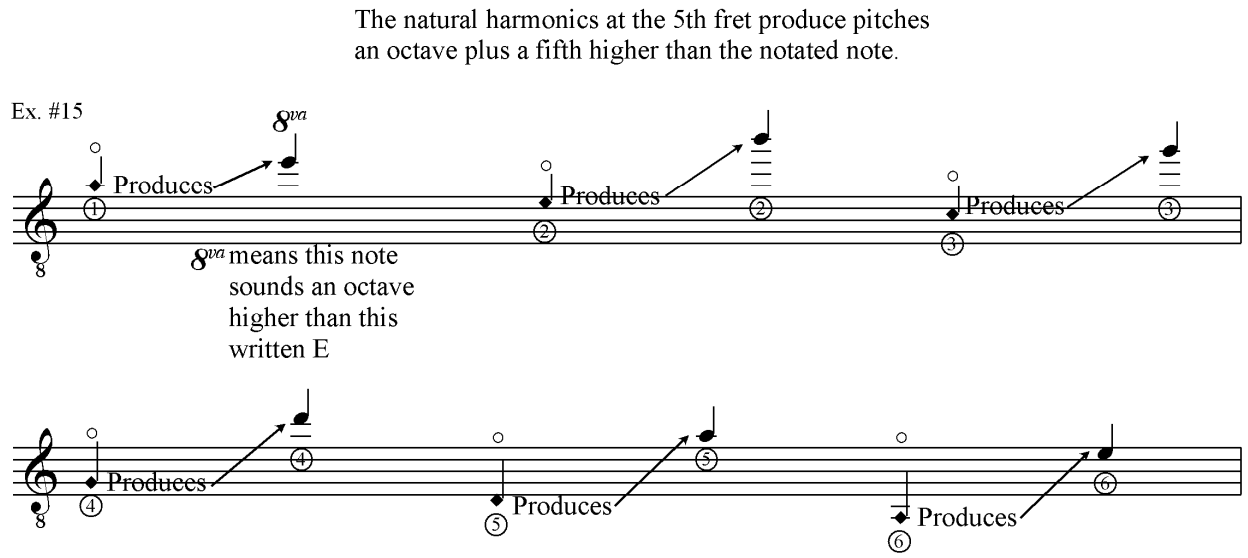
You are on DouglasNiedt.com

At the 7th fret, the pitch that comes out of the guitar is an octave higher than the written note (Ex. #14):

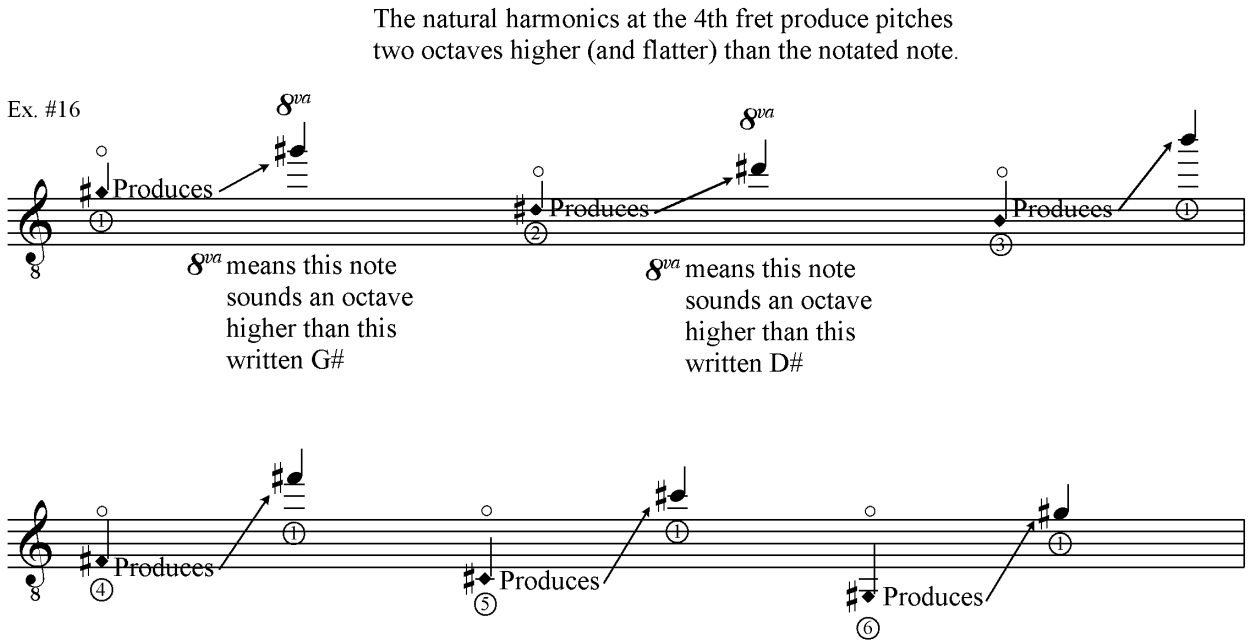


You are on DouglasNiedt.com

At the 5th fret, the pitch that comes out of the guitar is an octave plus a fifth higher than the written note (Ex. #15):



At the 4th fret, the pitch that comes out of the guitar is two octaves higher (though noticeably flatter) than the written pitch (Ex. #16):

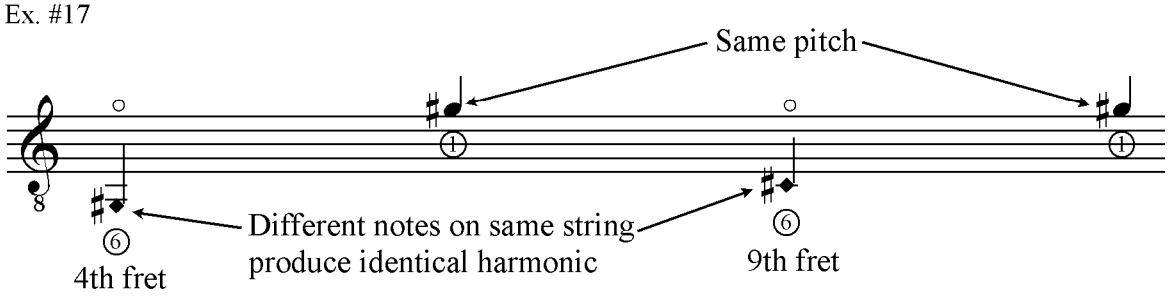


You are on DouglasNiedt.com

At the 9th fret, *the pitches that come out of the guitar are exactly the same as those at the 4th fret*. But the notation looks entirely different from that at the 4th fret because again, in this system of notation, we are indicating the note where the left-hand finger touches the string to produce the harmonic. The notes at the 9th fret are different from those at the 4th fret. Therefore, the harmonic notation looks different on paper. But the notes coming out of the guitar are identical (Ex.#17):

The natural harmonics produced at the 4th fret
and 9th fret on the same string are identical.

Ex. #17

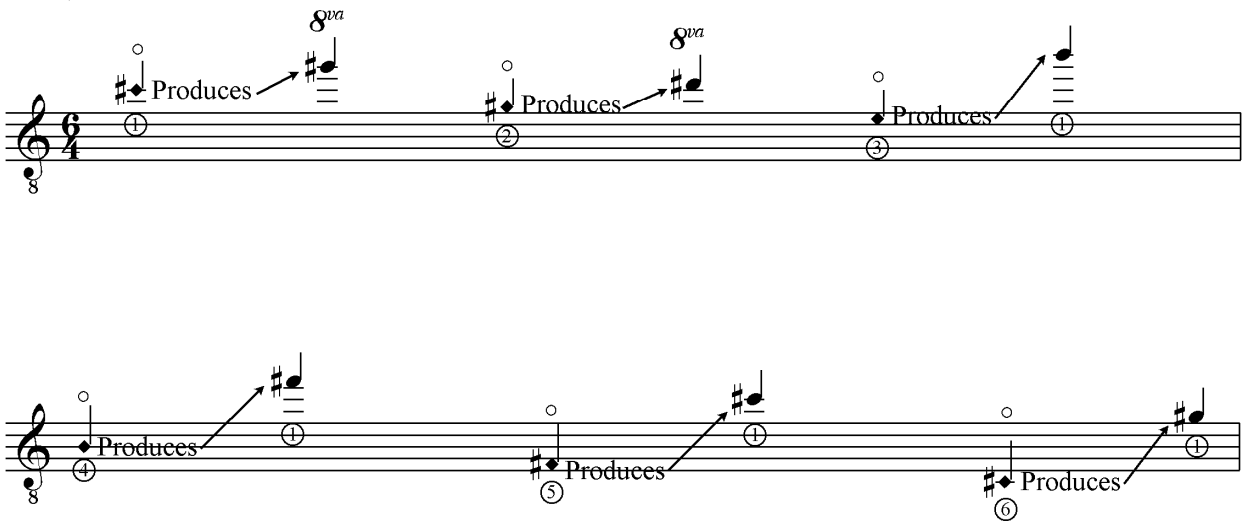


You are on DouglasNiedt.com

At the 9th fret the harmonics sound an octave plus a fifth higher than the notated pitch (Ex. #18):

The natural harmonics at the 9th fret produce pitches
an octave plus a fifth higher (and flatter) than the notated note.

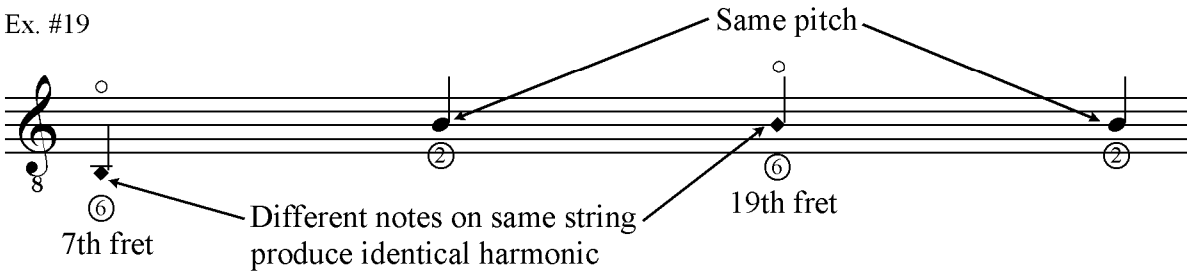
Ex. #18



At the 19th fret, *the pitches that come out of the guitar are exactly the same as those at the 7th fret*. But here again (as with the 4th and 9th frets), the notation for the 19th fret looks entirely different that at the 7th fret because this system of notation indicates the note where the left-hand finger touches the string to produce the harmonic. The notes at the 19th fret are different from those at the 7th fret. Therefore, the harmonic notation looks different on paper. But the notes coming out of the guitar are identical (Ex. #19):

The natural harmonics produced at the 7th fret and 19th fret on the same string are identical.

Ex. #19

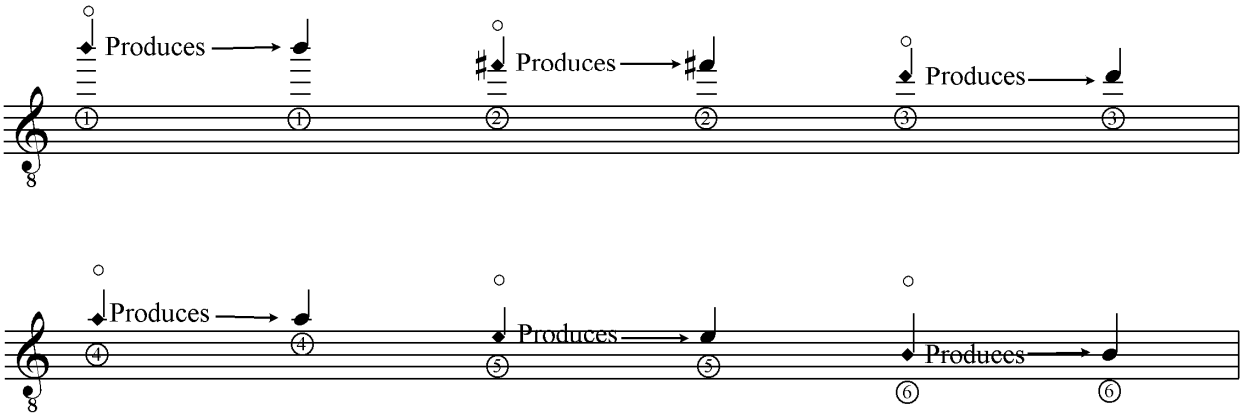


You are on DouglasNiedt.com

At the 19th fret the harmonics sound the same pitch as the written pitch (Ex. #20):

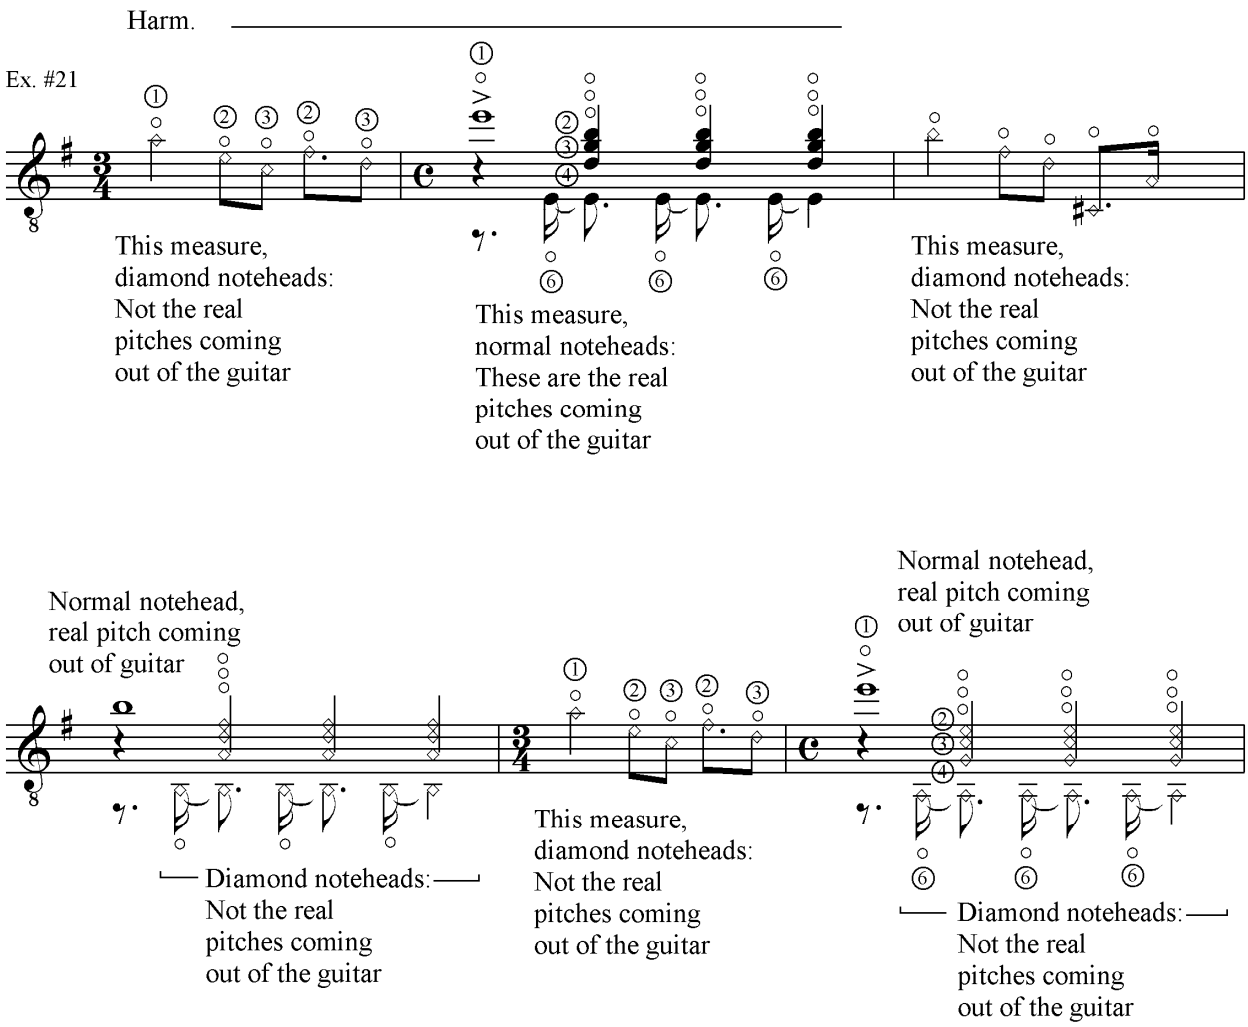
The natural harmonics at the 19th fret
produce the same pitch as the notated note.

Ex. #20



You are on DouglasNiedt.com

Some composer/arrangers who use this system of natural harmonic notation differentiate between harmonics that sound the same pitches as the written notes and those that produce different pitches from the written notes. In the well-known natural harmonic section of his *Prelude No. 4*, Heitor Villa-Lobos used this type of notation. Unfortunately the printed version has many mistakes in it (as do countless other passages of harmonics in Villa-Lobos' music). This is what he was intending to notate (Ex. #21):



You are on DouglasNiedt.com

Note Villa-Lobos' use of the open or hollow diamond noteheads. Other composers/arrangers use this notation as well. I suppose it emphasizes that these are harmonics, but I find it unnecessary. I think it is far preferable and less confusing to use the open or hollow diamond noteheads only for half-notes and whole-notes, as in normal notation. Using the open diamond noteheads for all note values can lead to misinterpretation or obfuscation of rhythms.

Incidentally, while we are on the subject of Villa-Lobos, another source of confusion in his music arises from the publisher/printer's use of the *same circle symbol* to indicate harmonics and normal open strings.

System #3 for notating natural harmonics

The third system for notating natural harmonics indicates only *the real pitch coming out of the guitar*. Sometimes, to help the performer locate the harmonic, additional information is given such as string, fret number (in Arabic or Roman numerals), and left-hand finger to use. Other times it is assumed the performer knows where to play the harmonic or can figure it out.

As with the first two systems of notation, the notehead may be a diamond or not, solid or hollow, and a circle may or may not be placed somewhere by the notehead. Likewise, one of the terms Harmonic (Harm. or Har.), Natural Harmonic (Nat. Harm., Nat. Har., or N.H.), Armonico or Armonica (Arm. or Ar.) may or may not be used.

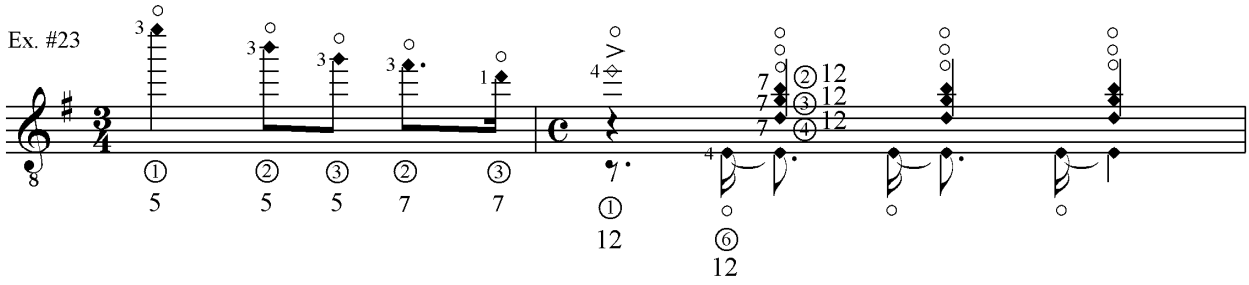
Proponents champion this system because it shows the real pitches that are intended to be played. In the other two systems, what you see on paper has nothing to do with what you are hearing.

Using this system, the first two measures of the harmonics section in Villa-Lobos' *Prelude No. 4* could be notated as follows. Remember, 8va (ottava) means the pitch sounds an octave higher than written. If the 8va symbol is not used, sometimes the very high pitches can be difficult to read. If it is used, sometimes the contour of the melody is not as clear (Ex. #22):

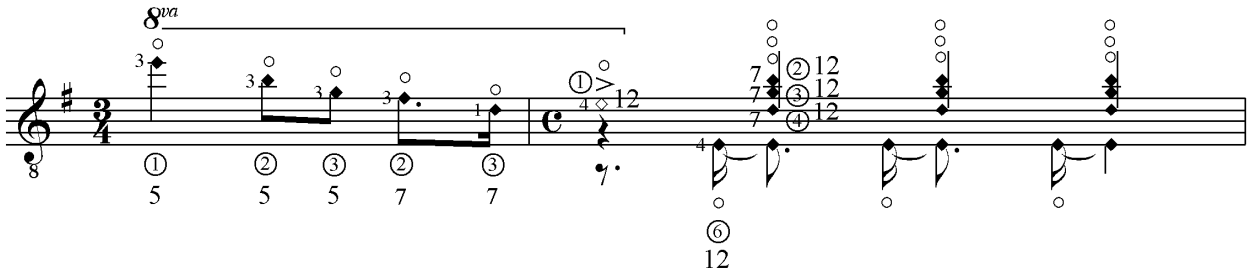
You are on DouglasNiedt.com

Without the designation of string and fret information, it can be a challenge to read this system of natural harmonic notation. Adding that information, plus left-hand fingering, makes it much easier (Ex. #23):

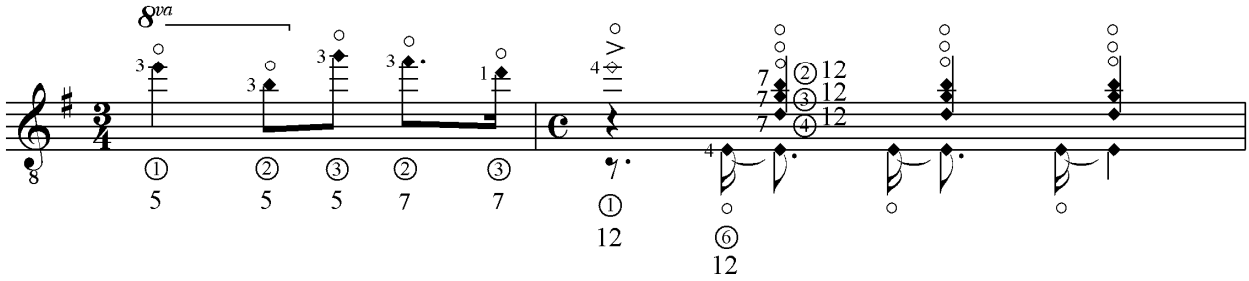
Without the use of 8va symbol
String, fret, and fingering numbers added.



With the use of 8va symbol
String, fret, and fingering numbers added.

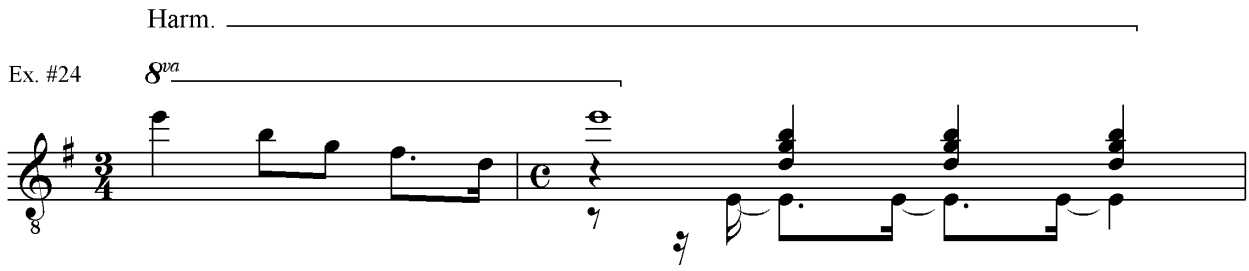


With the intermittent use of 8va symbol
String, fret, and fingering numbers added.



Again, keep in mind that a passage such as this can include all the bells and whistles of notation (diamond noteheads, circles indicating harmonics, and string, fret, and finger numbers) or may be notated in a barebones minimalist fashion such as this (Ex. #24):

Barebones, minimalist style of notation



You are on DouglasNiedt.com

Artificial Harmonic Notation

Artificial harmonics are notated at their sounding pitch sometimes with the use of ottava nomenclature. The reason I say ottava nomenclature is that the 8va sign may be used, or words such as:

- Harm. oct.
- El canto con armonicos (or arm. or ar.) octavados
- Melody in octave harmonics
- Octave harmonics
- Armonico octavado or Armonicos octavados (ar. 8 do or ar.8 dos)
- Armonia ottava (ar. ottava or ar. ott.)
- The fretted note with the word Harm. and the number 8 above or below the note.

And, as with natural harmonics, one may or may not see diamond noteheads (solid or hollow according to the note value, or all hollow), normal noteheads, circle symbols indicating

harmonics, string numbers, fret numbers (in Arabic or Roman numerals), and fingering numbers.

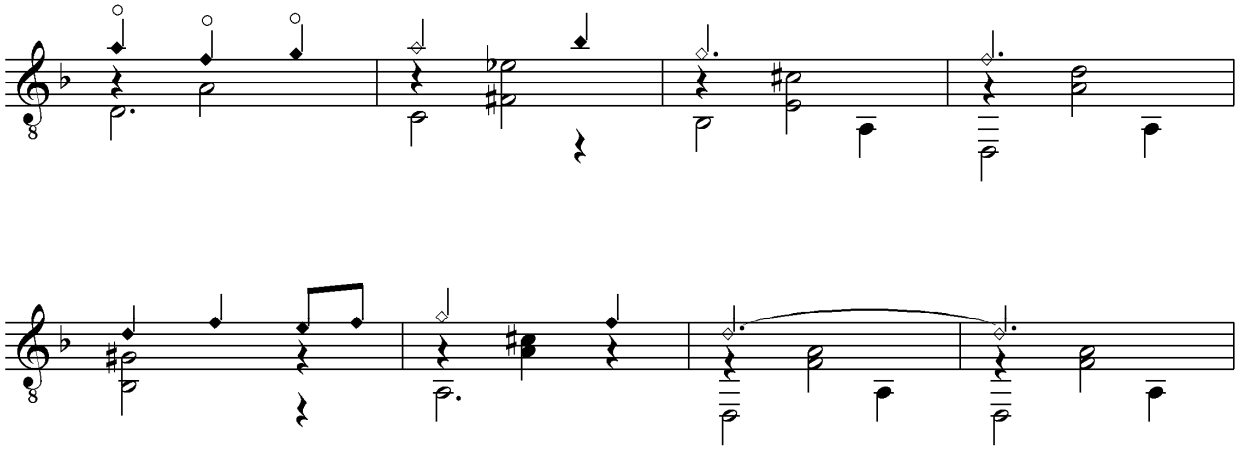
For example, the artificial harmonic section of *El Testament d'Amelia* harmonized by Miguel Llobet could be notated in the following ways (Ex. #25):

Normal noteheads

You are on DouglasNiedt.com

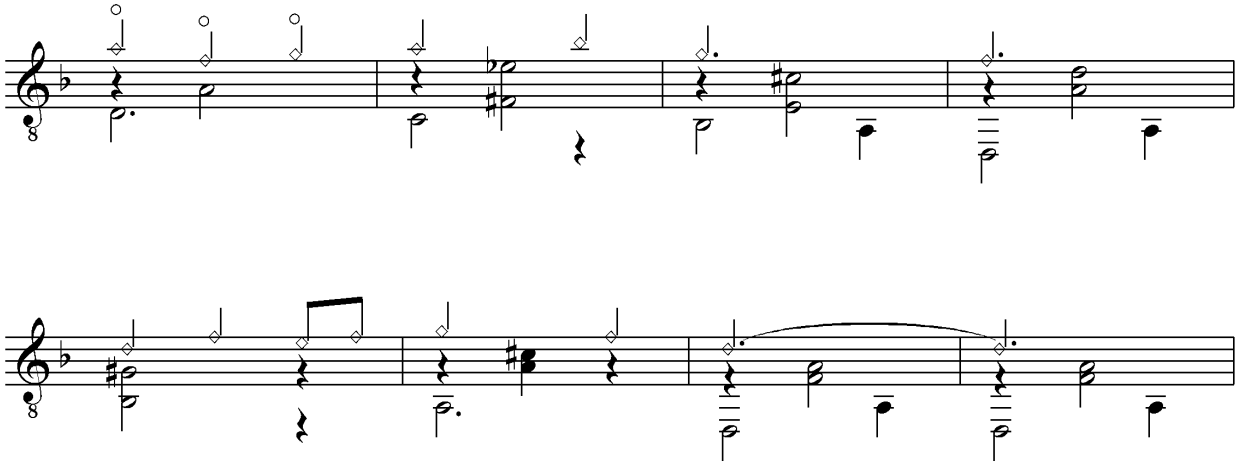
Diamond noteheads, solid or hollow according to rhythmic value of note

Instruction such as: El canto 8va or Melody 8va
Circles indicating harmonics may or may not be present



Diamond noteheads, all hollow to emphasize that they are harmonics

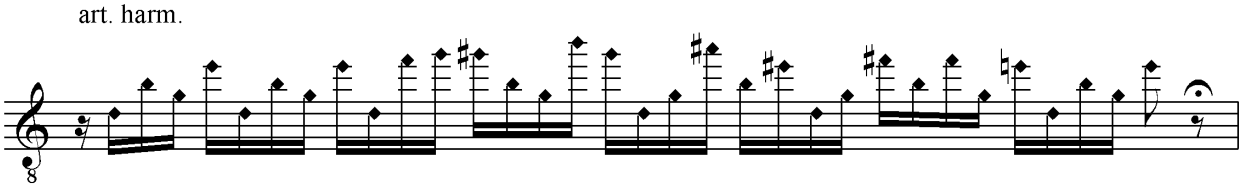
Instruction such as: Play melody in artificial harmonics
Circles indicating harmonics may or may not be present



In the sixth variation (“Dreaming”) of *Nocturnal*, Benjamin Britten notates artificial harmonics at pitch (Ex. #26):

Ex. #26

Nocturnal, "Dreaming" (variation #6)
Artificial harmonics notated at pitch.
No string, fret, or finger numbers given.

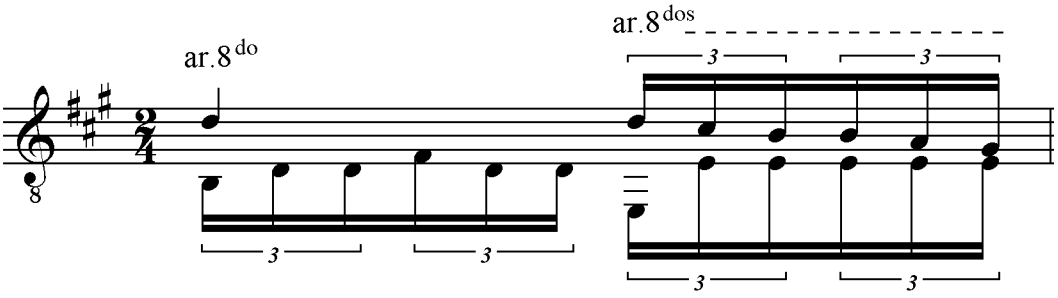


You are on DouglasNiedt.com

Here is a sample of Francisco Tárrega’s artificial harmonic notation (Ex. #27):

Ex. #27

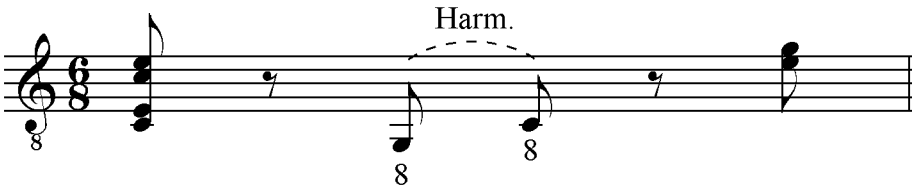
Francisco Tárrega's artificial harmonic notation
Sonata Beethoven, op. 13



Here is an example of artificial harmonics as notated by Fernando Sor in the fourth variation of his *Fantaisie*, Op. 6 (Ex.# 28):

Ex. #28

Fernando Sor's artificial harmonic notation
Fantaisie, Op. 6 (variation #4)

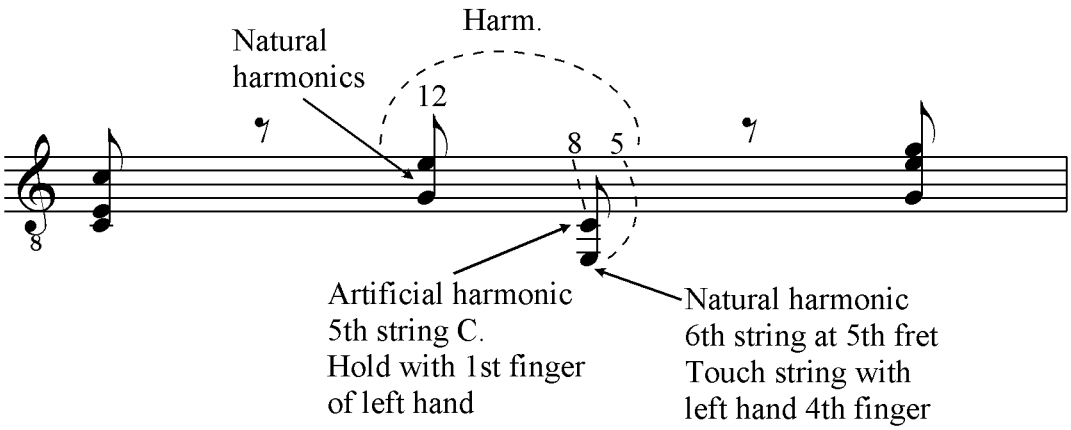


You are on DouglasNiedt.com

Look at this next example of Sor's notation in the same piece and variation. Here, we have an interval consisting of one note played as a natural harmonic, the other as an artificial harmonic (Ex. #29):

Ex. #29

Fernando Sor, *Fantaisie*, Op. 6 (variation #4)
Notation for simultaneous artificial and natural harmonic



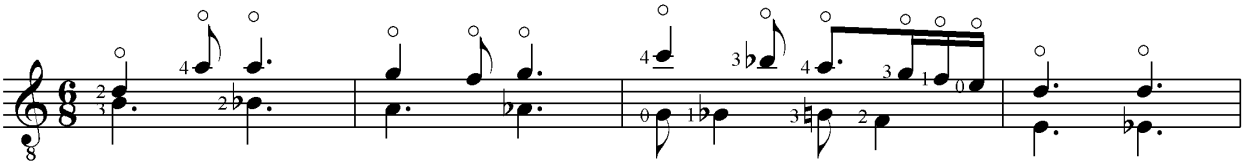
You are on DouglasNiedt.com

Note that the number 8 with a dashed line pointing to the note C is the only thing Sor uses to indicate the C is an artificial harmonic. He follows System #1 for the natural harmonics, writing the open string with a fret number.

In the third movement of his Nel Mezzo: Sonata, guitarist/composer David Leisner uses a minimalist style of notating artificial harmonics (Ex. #30):

Ex. #30

Example of minimalist notation for artificial harmonics.
Nel Mezzo: Sonata, 3rd movement by David Leisner



One more example of minimalist notation of artificial harmonics occurs in two measures of the *Omaggio* by Manuel de Falla, arranged and fingered by Miguel Llobet (Ex. #31):

Ex. #31

Omaggio by Manuel de Falla
Arranged and fingered by Miguel Llobet
Minimalist artificial harmonic notation

You are on DouglasNiedt.com

Those are the notational schemes you will encounter for artificial harmonics in the classical guitar repertoire. Keep in mind these schemes will be altered by the numerous notational variations already mentioned such as diamond noteheads, standard noteheads, circles to designate harmonics, as well as the many descriptive terms added above or at the beginning of the passage.

It gets worse

I know. It's complicated enough as it is. But now, add in publisher/printer/composer/arranger errors such as:

- Mixing diamond noteheads and standard noteheads for no reason within the same passage (or even the same measure!)
- Using the same circle symbol for harmonics and open strings.
- Notating a harmonic in the wrong octave. Or not specifying which octave it is in.
- Mixing two different types of natural harmonic notation in the same piece.
- Not specifying when natural harmonics are to be played as right-hand harmonics.
- Not clearly specifying which notes of a chord or interval are harmonics and which are not.

No wonder we're all confused!

I've spent twenty hours of a beautiful weekend preparing this technique tip to help guide you through the murky underworld of harmonic notation. But, you may *still* encounter an indecipherable passage of harmonics. But don't be discouraged. When confronted with a passage of harmonics that you just can't figure out, even with all the information I've given you here, do what I do. Listen to how John Williams plays it! Haha. Or, just make your best wild guess.
